## **LAB REPORT On**

### **ADVANCED DATA STRUCTURES (22CS5PEADS)**

**Submitted by**

**HARSH GHIYA (1BM21CS073)**

**in partial fulfillment for the award of the degree of  
BACHELOR OF ENGINEERING  
in  
COMPUTER SCIENCE AND ENGINEERING**

**B.M.S. COLLEGE OF ENGINEERING  
(Autonomous Institution under VTU)  
BENGALURU-560019  
March -June 2024**

**B. M. S. College of Engineering,  
Bull Temple Road, Bangalore 560019  
(Affiliated To Visvesvaraya Technological University, Belgaum)  
Department of Computer Science and Engineering**

This is to certify that the Lab work entitled “**ADVANCED DATA STRUCTURES**” carried out by **HARSH GHIYA (1BM21CS073)**, who is bonafide student of **B. M. S. College of Engineering**. It is in partial fulfillment for the award of **Bachelor of Engineering in Computer Science and Engineering** of the Visvesvaraya Technological University, Belgaum during the year 2023-24. The Lab report has been approved as it satisfies the academic requirements in respect of Advanced Data structures Lab - (**22CS5PEADS**) work prescribed for the said degree.

**Prof. Namratha M**  
Assistant Professor  
Department of CSE  
BMSCE, Bengaluru

**Dr. Jyothi S Nayak**  
Professor and Head

7	Write a program to implement insertion operation on a B-tree.	26
8	Write a program to implement functions of Dictionary using Hashing.	34
9	Write a program to implement the following functions on a Binomial heap: Insert(), getMin(), extractMin()	42
10	Write a program to implement the following functions on a Binomial heap: delete() and decrease().	48

**Course outcomes:**

CO1	Apply the concepts of advanced data structures for the given scenario.
CO2	Analyze the usage of appropriate data structure for a given application.
CO3	Design algorithms for performing operations on various advanced data structures.
CO4	Conduct practical experiments to solve problems using an appropriate data structure.

## Lab program 1:

Write a program to implement the following list:

An ordinary Doubly Linked List requires space for two address fields to store the addresses of previous and next nodes. A memory efficient version of Doubly Linked List can be created using only one space for address field with every node. This memory efficient Doubly Linked List is called XOR Linked List or Memory Efficient as the list uses bitwise XOR operation to save space for one address. In the XOR linked list, instead of storing actual memory addresses, every node stores the XOR of addresses of previous and next nodes.

Code:

```
#include <cstdlib>
```

```
#include <iostream>
```

```
struct Node {
```

```
    int data;
```

```
    Node* both;
```

```
};
```

```
class XORLinkedList {
```

```
private:
```

```
    Node* head;
```

```
    Node* tail;
```

```
    Node* XOR(Node* a, Node* b);
```

```
public:
```

```
    XORLinkedList();
```

```
void insert_at_head(int data);
```

```

```

## Lab Program 2:

Write a program to perform insertion, deletion and searching operations on a skip list.

Code:

```
#include <bits/stdc++.h>

using namespace std;

// Class to implement node
class Node {
public:
    int key;
    Node** forward;
    Node(int, int);
};

Node::Node(int key, int level) {
    this->key = key;
    forward = new Node*[level+1];
    memset(forward, 0, sizeof(Node*) * (level+1));
}

// Class for Skip list
class SkipList {
    int MAXLVL;
    float P;
    int level;
    Node* header;
public:
    SkipList(int, float);
```

```

int randomLevel();

Node* createNode(int, int);

void insertElement(int);

void deleteElement(int);

void searchElement(int);

void displayList();

};

SkipList::SkipList(int MAXLVL, float P) {
    this->MAXLVL = MAXLVL;
    this->P = P;
    level = 0;
    header = new Node(-1, MAXLVL);
}

int SkipList::randomLevel() {
    float r = (float)rand() / RAND_MAX;
    int lvl = 0;
    while (r < P && lvl < MAXLVL) {
        lvl++;
        r = (float)rand() / RAND_MAX;
    }
    return lvl;
}

Node* SkipList::createNode(int key, int level) {
    Node* n = new Node(key, level);
    return n;
}

```

```

void SkipList::insertElement(int key) {
    Node* current = header;

### Lab Program 3:

Given a boolean 2D matrix, find the number of islands. Use disjoint sets to implement the above scenario.

Code:

```
#include <bits/stdc++.h>

using namespace std;

class DisjointUnionSets {
    vector<int> rank, parent;
    int n;

public:
    DisjointUnionSets(int n) {
        rank.resize(n);
        parent.resize(n);
        this->n = n;
        makeSet();
    }

    void makeSet() {
        for (int i = 0; i < n; i++)
            parent[i] = i;
    }

    int find(int x) {
        if (parent[x] != x) {
            parent[x] = find(parent[x]);
        }
        return parent[x];
    }
}
```

```

void Union(int x, int y) {
    int xRoot = find(x);
    int yRoot = find(y);

    if (xRoot == yRoot)
        return;

    if (rank[xRoot] < rank[yRoot])
        parent[xRoot] = yRoot;
    else if (rank[yRoot] < rank[xRoot])
        parent[yRoot] = xRoot;
    else {
        parent[yRoot] = xRoot;
        rank[xRoot] = rank[xRoot] + 1;
    }
}

};

int countIslands(vector<vector<int>> a) {
    int n = a.size();
    int m = a[0].size();

    DisjointUnionSets* dus = new DisjointUnionSets(n * m);

    for (int j = 0; j < n; j++) {
        for (int k = 0; k < m; k++) {
            if (a[j][k] == 0)
                continue;

```

```

        if (j + 1 < n && a[j + 1][k] == 1)
            dus->Union(j * m + k, (j + 1) * m + k);
        if (j - 1 >= 0 && a[j - 1][k] == 1)
            dus->Union(j * m + k, (j - 1) * m + k);
        if (k + 1 < m && a[j][k + 1] == 1)
            dus->Union(j * m + k, j * m + k + 1);
        if (k - 1 >= 0 && a[j][k - 1] == 1)

```

## Lab Program 8:

Write a program to to implement functions of Dictionary using Hashing.

Code:

```
#include <iostream>
#include <vector>
#include <list>

using namespace std;

// Class for the dictionary
class Dictionary {
private:
    static const int TABLE_SIZE = 10;
    vector<list<pair<int, string>>> table;

    // Hash function
    int hashFunction(int key) {
        return key % TABLE_SIZE;
    }

public:
    // Constructor
    Dictionary() {
        table.resize(TABLE_SIZE);
    }

    // Function to insert a key-value pair
    void insert(int key, const string& value) {
        int index = hashFunction(key);
        table[index].push_back(make_pair(key, value));
    }
};
```

```

    }

    // Function to search for a value given a key
    string search(int key) {
        int index = hashFunction(key);
        for (auto& entry : table[index]) {
            if (entry.first == key) {
                return entry.second;
            }
        }
        return "Key not found";
    }
};

int main() {
    Dictionary dictionary;

    // Insert some key-value pairs
    dictionary.insert(1, "Apple");
    dictionary.insert(11, "Banana");
    dictionary.insert(21, "Orange");

    // Search for some keys
    cout << "Value for key 1: " << dictionary.search(1) << endl;
    cout << "Value for key 11: " << dictionary.search(11) << endl;
    cout << "Value for key 21: " << dictionary.search(21) << endl;
    cout << "Value for key 2: " << dictionary.search(2) << endl;

    return 0;
}

```

Outputs:

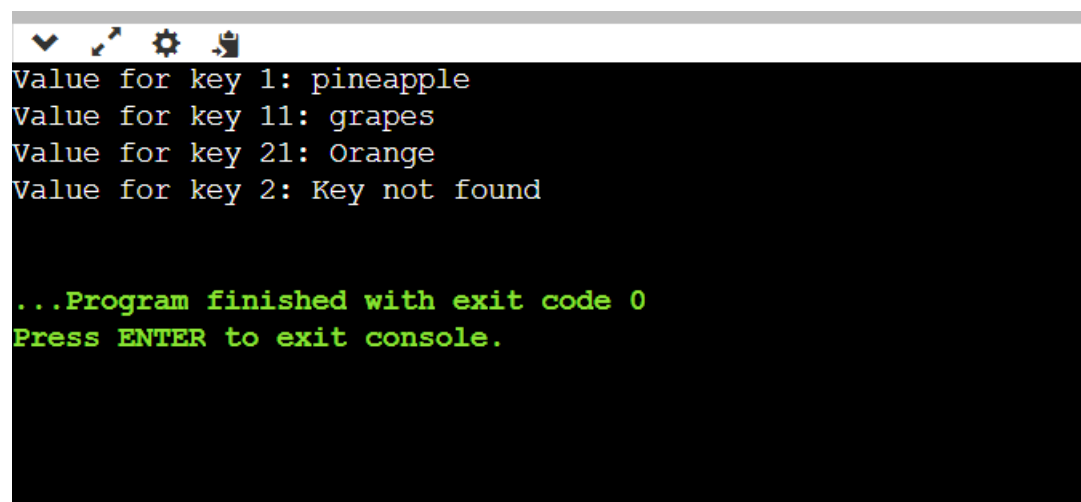

Output\_1:

A terminal window with a dark background and a light gray title bar. The title bar contains four icons: a checkmark, a cursor, a gear, and a document. The terminal displays the following text in a monospaced font: 'value for key 1: Apple', 'value for key 11: Banana', 'value for key 21: Orange', and 'value for key 2: Key not found'. Below this, in green text, it says '..Program finished with exit code 0' and 'Press ENTER to exit console.' with a white cursor at the end.

```
value for key 1: Apple
value for key 11: Banana
value for key 21: Orange
value for key 2: Key not found

..Program finished with exit code 0
Press ENTER to exit console.
```

Output\_2:

A terminal window with a dark background and a light gray title bar. The title bar contains four icons: a checkmark, a cursor, a gear, and a document. The terminal displays the following text in a monospaced font: 'Value for key 1: pineapple', 'Value for key 11: grapes', 'Value for key 21: Orange', and 'Value for key 2: Key not found'. Below this, in green text, it says '...Program finished with exit code 0' and 'Press ENTER to exit console.' with a white cursor at the end.

```
Value for key 1: pineapple
Value for key 11: grapes
Value for key 21: Orange
Value for key 2: Key not found

...Program finished with exit code 0
Press ENTER to exit console.
```

## Lab Program 9:

Write a program to implement the following functions on a Binomial heap: Insert(), getMin(), extractMin().

Code:

```
#include<bits/stdc++.h>

using namespace std;

struct Node
{
    int data, degree;
    Node *child, *sibling, *parent;
};

Node* newNode(int key)
{
    Node *temp = new Node;
    temp->data = key;
    temp->degree = 0;
    temp->child = temp->parent = temp->sibling = NULL;
    return temp;
}

Node* mergeBinomialTrees(Node *b1, Node *b2)
{
    if (b1->data > b2->data)
        swap(b1, b2);

    b2->parent = b1;
    b2->sibling = b1->child;
    b1->child = b2;
    b1->degree++;
}
```

```

    return b1;
}

list<Node*> unionBionomialHeap(list<Node*> l1,
                               list<Node*> l2)
{
    list<Node*> _new;
    list<Node*>::iterator it = l1.begin();
    list<Node*>::iterator ot = l2.begin();
    while (it!=l1.end() && ot!=l2.end())
    {

        if((*it)->degree <= (*ot)->degree)
        {
            _new.push_back(*it);
            it++;

## Lab Program 10:

Write a program to implement the following functions on a Binomial heap: delete() and decrease().

Code:

```
#include <bits/stdc++.h>

using namespace std;

// Structure of Node

struct Node {
    int val, degree;
    Node *parent, *child, *sibling;
};

Node* root = NULL;

// link two heaps by making h1 a child
// of h2.

int binomialLink(Node* h1, Node* h2)
{
    h1->parent = h2;
    h1->sibling = h2->child;
    h2->child = h1;
    h2->degree = h2->degree + 1;
}

// create a Node

Node* createNode(int n)
{
    Node* new_node = new Node;
    new_node->val = n;
    new_node->parent = NULL;
```

```

        new_node->sibling = NULL;
        new_node->child = NULL;
        new_node->degree = 0;
        return new_node;
    }

// This function merge two Binomial Trees
Node* mergeBHeaps(Node* h1, Node* h2)
{
    if (h1 == NULL)
        return h2;
    if (h2 == NULL)
        return h1;

    // define a Node
    Node* res = NULL;

    // check degree of both Node i.e.
    // which is greater or smaller
    if (h1->degree <= h2->degree)
        res = h1;

    else if (h1->degree > h2->degree)
        res = h2;

    // traverse till if any of heap gets empty
    while (h1 != NULL && h2 != NULL) {
        // if degree of h1 is smaller, increment h1
        if (h1->degree < h2->degree)

```

```

        h1 = h1->sibling;

        // Link h1 with h2 in case of equal degree
        else if (h1->degree == h2->degree) {
            Node* sib = h1->sibling;
            h1->sibling = h2;
            h1 = sib;
        }

        // if h2 is greater
        else {
            Node* sib = h2->sibling;
            h2->sibling = h1;
